## **FOR IMMEDIATE RELEASE**

### **Epoxy Fiberglass Elbows Improve Lifecycle Performance for Data Center Cabling Applications**

*Atkore's FRE Composites fiberglass wound elbows provide versatility and longevity for growing number of data centers...*

Atkore has tailored its FRE® epoxy fiberglass elbows to suit the needs of today's data center applications. With the bending flexibility of fiberglass elbows, the most intricate of data centers can be constructed without the worry of sacrificing efficiency, strength, or safety. Atkore's fiberglass elbows provide installations with a low coefficient of friction and reduced burn-through on electrical cables, assuring a secure system with superior mechanical properties.

"Data management has become a focal point for businesses today. With the ever-increasing construction of new data centers, our fiberglass elbows make the process of pulling wire easier and more reliable whether it's 600 volt or medium voltage installations," says Tom Feissle, Director of Business Development at Atkore. "When it comes to corrosion resistance, ease of installation and reliability, our FRE fiberglass elbows are made to perform, especially for data centers."

Offered with straight, belled, threaded and PVC coupling ends, Atkore's epoxy fiberglass conduit elbows can be paired with various conduit types. No more wrapping heavy rigid conduit and no more burn-through on expensive cables. So, go ahead and make longer pulls with more confidence when using FRE Composites' Fiberglass elbows.
